## 1. Proposal

My project is developed under python programming for movie rental system. It is suitable for both customer and owner. The main purpose for developing this project Movie Rental System is to easily access for movie fan to get there interested movie cd for rent. With the help of this system the owner can easily know customer details, renting details and other inventories reports.

The movie rental system is one of the best ways to draw more and more customer and offers best services. With this system the owner can run 24 hrs services to their customer. This system easily records the information of customer and movies because of this feature it can bring small or medium rental business in next level.

## 2. Introduction

As all we that this is the era of science and technology where a computer plays a vital role.as the number of people have the knowledge and access on the technology this movie rental system helps them to easily access for the movies cd which they wanted rent at low cost and short period of time. The movie rental system can carry out the rental services 24x7,365 days per year. This system easily shows the available information, holds customer details and return details.

For developing this system, we have to have the knowledge on programming or coding. Programming is the main key for developing any system, software, etc. The features of the movie rental program are as follows:

- It reads the data of the text files and shows the information of the subject or movies which are available for renting.
- It allows user to enter in a system and allow to rent and return the movies
- When customer rent the movie, it generates the invoice and kept the information of movie and customer which are needed.
- When customer successfully, rent the movie it calculates the price and update the movie system.
- When customer want to return movie, it records the information of customer and movie and charge the fine if customer has rented the movie more than 10 days. And again, updates the information.
- It also allows the user to enter in the system and directly exit without renting and returning.

### **3. Discussion and analysis**

While creating this project we have to do following steps.

- Proposal
  - Introduction
  - Writing code
  - Doing flowchart, algorithm
  - Testing
- Some of the tools that were used for creating this project.
- Google
  - Ms-word
  - Python

#### **4. Algorithms**

Step1: Start the main function of program.

Step2: Display the information and get the input from the customer for renting, returning and exiting.

Step3: If the customer wants to rent movie displays the information of movie and take customer and movie details and print the price of movie.

Step4: If the customer wants to rent more than one movie, we have to add price.

Step5: If renting movie is successful, we have to update the information.

Step6: If the customer wants to return movie, information of movie and customer should be taken.

Step6: while returning movie if the returning date is more than 10 days. we have to charge fine.

Step7: If customer does not want to rent and return then the program exits along with the exit of customer

Step8: Closing of program is done when customer chose to exit.

#### 4.1. Flowchart

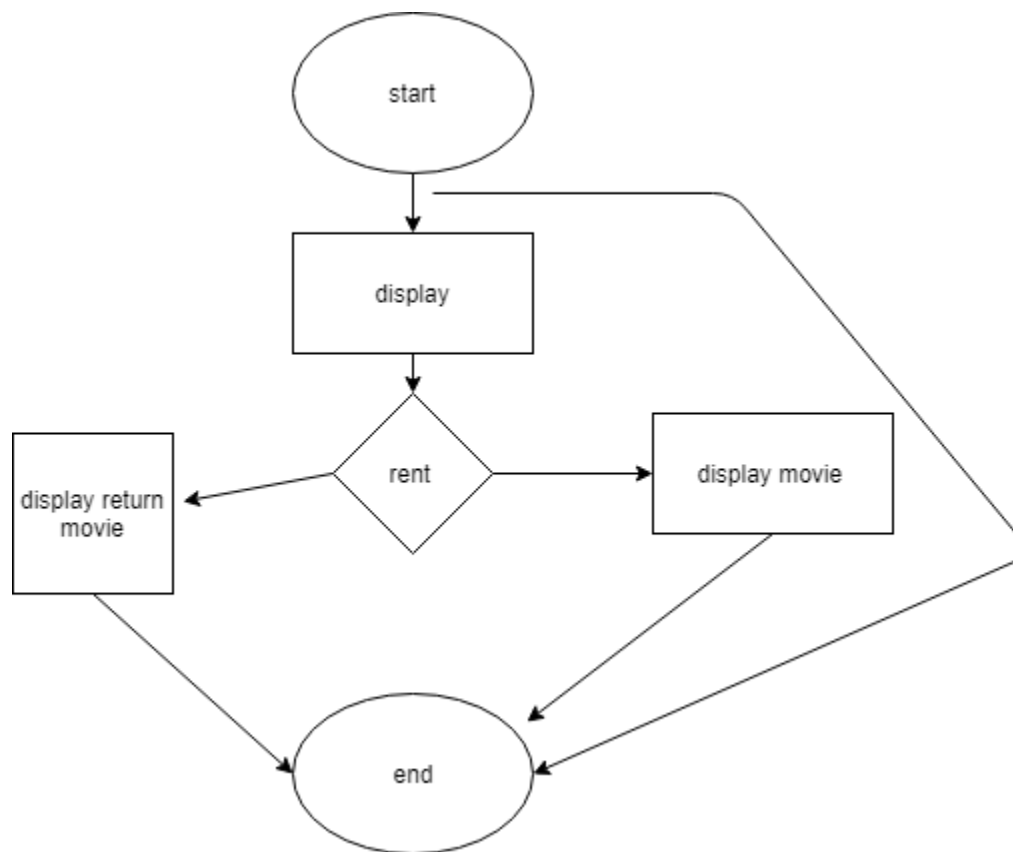

Figure 1: flowchart

Fig.1flowchart

#### **4.2. Pseudocode**

Reads text files

def main():

    decision="yes"

    while decision=="yes":

        a=open('list.txt','r')

        print(a.read())

        a.close()

renting

def updatereent(lid):

    b=lid-1

    for z in range(0,3):

        moviequantity[z]=moviequantity[z]-1

updating

update=open("rent.txt",'a')

```

    update.write("Name of the custmor:"+Name+ "\n" +"movieno:"+str(Id)+"\n"+"Renting
date:"+str(Date)+"\n")
    update.write("\n")
    update.write("\n")
    update.close()
renting
returning=open("return.txt","a")
    returning.write("Name of the Customer:"+Name+ "\n" +"Movie Number"+str(number)+
"\n"+"Returning Movie Date:"+str(Date)+"\n")
    print("-----update-----")
    returning.write("\n")
    returning.write("\n")

```

```

returning def moviereturn():
    for z in range(0,3):
        print("No. ",z+1,"Movie Name:",movieName[z],"Movie Price:",moviePrice[z],"Movie
Quantity:",moviequantity[z])
        Name=input("Enter your Name:")
        number=int(input("Enter the number of movie you have rented :"))

```

```

update
def moviereturn():
    for z in range(0,3):
        print("No. ",z+1,"Movie Name:",movieName[z],"Movie Price:",moviePrice[z],"Movie
Quantity:",moviequantity[z])
        Name=input("Enter your Name:")
        number=int(input("Enter the number of movie you have rented :"))

```

```
    if number==1:  
exit  
if a=="yes":  
    main()  
else:  
    sys.exit()
```

## 5. Data Structures

Data structures are a way of data organization and storage that allows for efficient access and use. Many different types of data structure are defined to enable the data scientists to focus on the main scenario of solving major problems, instead of losing their attention to data description and access details. There are two types of data structures they are primitive and non-primitive (Jaiswal, 2017)).

### 5.1. Primitive data Structures

Primitive data structures are the basic structures of data. They are data manipulation building blocks containing pure, simple data values. There are four primitive variables in python.

#### 1.Integers

We can use an integer to show numeric data and, in particular, whole numbers from negative to positive infinity, such as 1,4, 5 or -1 (Jaiswal, 2017).

#### 2.Float

Float is the number of floating points, which usually ends with a decimal number such as 1.11, 0.44 or 3.14 (wentworth, 2012).

#### 3.Strings

Alphabet, strings, word or another collection of character. You can create strings in Python by inserting a sequence of characters in a single or double quote. For example,

' Girija ' and ' Tamang ' (Jaiswal, 2017).

#### 4.Boolean

Booleans are useful in terms of conditionality and comparison. This datatype only takes the value: True and False (wentworth, 2012).

## 5.2. Non-Primitive Data Structures

The sophisticated members of the data organization family are non-primitive types. They store not only a value, but a collection of values in different sizes.

The types of non-primitive data structures are:

1. List

Python lists are used to store collections of mixed items. These are mutable, which means that without changing their identity, we can change their content. Lists of elements separated by a comma can be identified with its square brackets [ and]. Python provides many methods for manipulating and working with lists. Normal list manipulations include adding new items to a list, removing items from a list, sorting or reversing a list (wentworth, 2012).

2. Tuples

Tuples are another standard type of sequence data which is similar to the list. The difference between tuples and list is that tuples are immutable, meaning you can't delete, add or edit any values within them once you have defined them (Jaiswal, 2017).

3. Dictionary

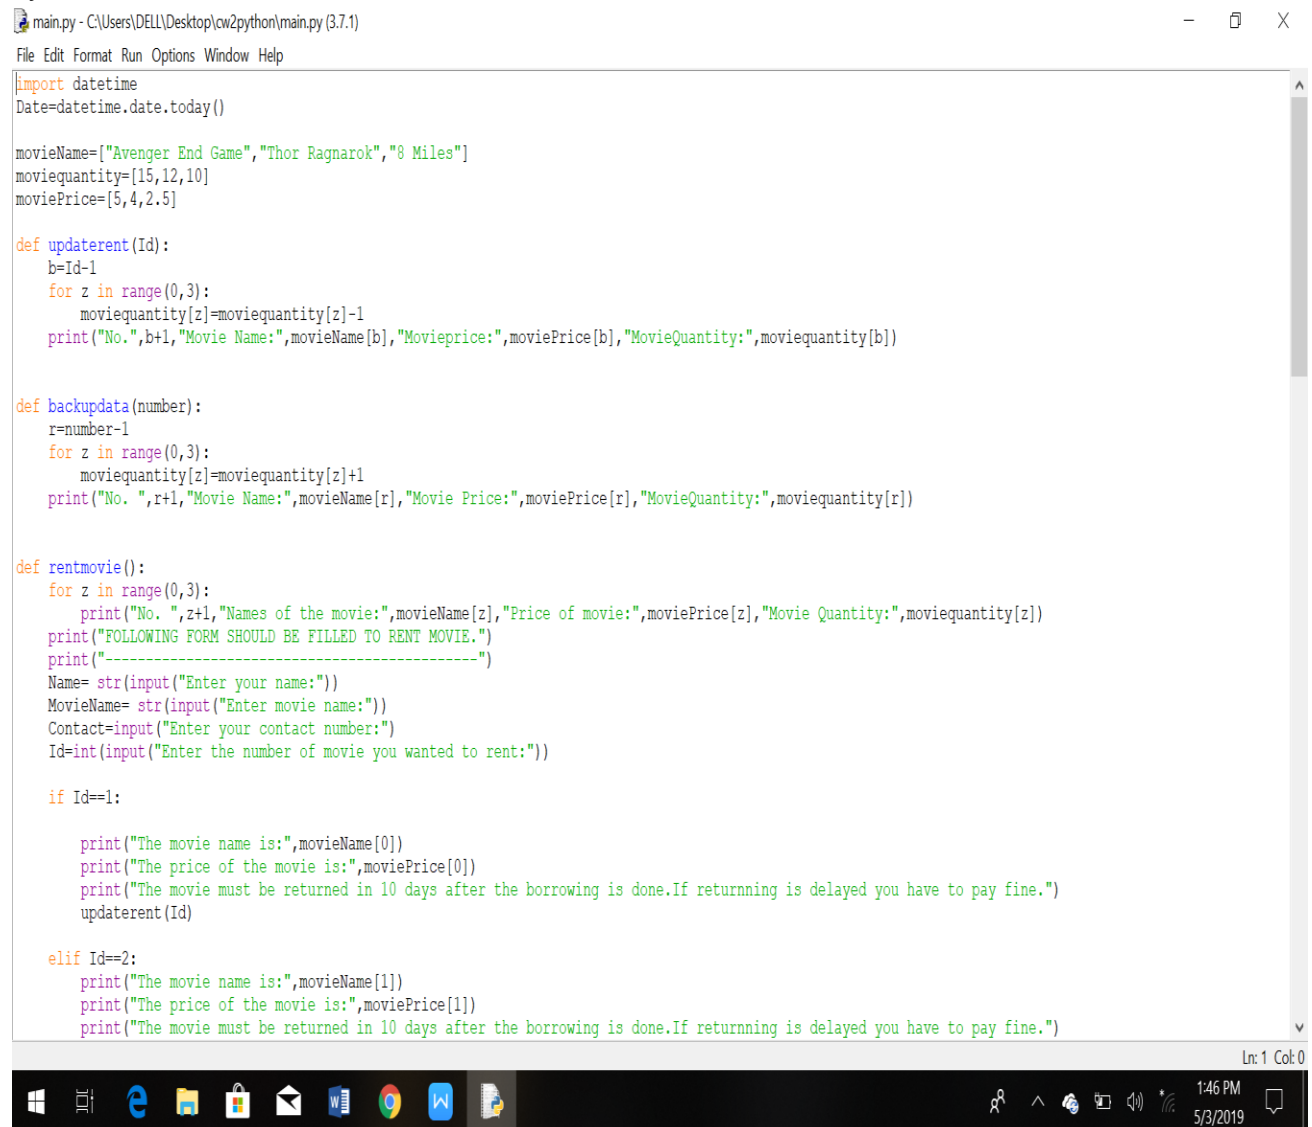

Dictionary is an ordered collection of pairs of key value. Usually it is used when we have an enormous amount of data. We need to know the key to retrieve the value. In python, dictionaries are defined in braces {} with each item being a pair in the key: value. Key and value of could be if any type. Keys are usually numbers or string. While any arbitrary python object may be values. Dictionaries are enclosed with curly braces ({}), and square braces ([]) can be used to assign and access values (wentworth, 2012).

4. Set

Sets are a collection of unordered stuffs which are unique. These are useful for creating lists containing single data only. It's an unordered, but mutable collection which are very helpful for a large dataset to be processed. Since sets are unordered, there is no concept of index and specific order. They are denoted by {}. (Sturtz, 2017)

## 6.Program

The project of movie rental system is given below. While developing this project I have used loop like if, for, while. The code s which were used for developing the movie rental system is:

```

main.py - C:\Users\DELL\Desktop\cw2python\main.py (3.7.1)
File Edit Format Run Options Window Help

import datetime
Date=datetime.date.today()

movieName=["Avenger End Game","Thor Ragnarok","8 Miles"]
moviequantity=[15,12,10]
moviePrice=[5,4,2.5]

def updatereent(Id):
    b=Id-1
    for z in range(0,3):
        moviequantity[z]=moviequantity[z]-1
    print("No. ",b+1,"Movie Name:",movieName[b],"Movieprice:",moviePrice[b],"MovieQuantity:",moviequantity[b])

def backupdata(number):
    r=number-1
    for z in range(0,3):
        moviequantity[z]=moviequantity[z]+1
    print("No. ",r+1,"Movie Name:",movieName[r],"Movie Price:",moviePrice[r],"MovieQuantity:",moviequantity[r])

def rentmovie():
    for z in range(0,3):
        print("No. ",z+1,"Names of the movie:",movieName[z],"Price of movie:",moviePrice[z],"Movie Quantity:",moviequantity[z])
    print("FOLLOWING FORM SHOULD BE FILLED TO RENT MOVIE.")
    print("-----")
    Name= str(input("Enter your name:"))
    MovieName= str(input("Enter movie name:"))
    Contact=input("Enter your contact number:")
    Id=int(input("Enter the number of movie you wanted to rent:"))

    if Id==1:

        print("The movie name is:",movieName[0])
        print("The price of the movie is:",moviePrice[0])
        print("The movie must be returned in 10 days after the borrowing is done.If returnning is delayed you have to pay fine.")
        updatereent(Id)

    elif Id==2:
        print("The movie name is:",movieName[1])
        print("The price of the movie is:",moviePrice[1])
        print("The movie must be returned in 10 days after the borrowing is done.If returnning is delayed you have to pay fine.")
  
```

Figure 2: program 1

```

            backupdata(number)

        else:
            print("you have enter something wrong")
            print("After the program starts again,please enter a valid movie number.")

def logic(a):

Ln:9 Col:0

```

The screenshot shows a Python IDE window titled 'main.py - C:\Users\DELL\Desktop\cw2python\main.py (3.7.1)'. The menu bar includes 'File', 'Edit', 'Format', 'Run', 'Options', 'Window', and 'Help'. The code is a Python script for a movie rental system. It starts with a print statement, followed by a 'logic' function that checks if a user wants to continue. The 'main' function handles the movie rental logic, including opening a file to read movie details, displaying them, and processing user input for renting, returning, or exiting. The script ends with a call to 'main()'. The status bar at the bottom right indicates 'Ln: 9 Col: 0'. The Windows taskbar is visible at the bottom with various application icons and a system clock showing 1:52 PM on 5/3/2019.

```
